Health, Safety and Environment — Incident Report June 2024

Incident Classification: Near-Miss — No injury

Date: June 14, 2024

Location: Construction Site B, Level 3 Scaffolding

Reported by: Site Supervisor K. Andersen

Description of Incident

A near-miss incident occurred when a worker's safety harness was found incompatible with the newly installed anchor points on Level 3. The worker was secured through an alternative method before any fall risk materialized.

Root Cause Analysis

1. Procurement of anchor points did not cross-reference approved harness models.
2. Pre-shift equipment inspection checklist did not include harness compatibility.
3. Site induction materials had not been updated following anchor point replacement.

Corrective Actions

Immediate: All Level 3 anchor points inspected and tagged. Incompatible combinations removed from service pending review.

Short-term: HSE committee to update equipment compatibility matrix. Pre-shift checklist revised to include compatibility check.

Long-term: Procurement process to include HSE sign-off before ordering safety-critical equipment. Annual cross-training session for site supervisors on equipment compatibility requirements.

Lessons Learned

Procurement and HSE must coordinate on specification changes for safety equipment. Near-miss reporting culture remains strong — this incident demonstrates that workers feel empowered to flag risks before they become injuries.
